

OUR MISSION

The mission of the American Physiological Society is to promote the discipline of physiology and thereby enhance human and animal health by disseminating research discoveries, facilitating research and scientific interaction, educating the public, and enabling future generations of physiologists.

Our key priorities are to:

- Ensure the highest quality research and exchange of ideas;
- Sustain investments in basic and translational life sciences research and;
- Develop future physiologists.

OUR CORE VALUES

The Society's core values are professionalism and exceptional service to our members, pursuit of scientific investigation, encouragement of professional growth and development, and recognition of scientific accomplishments.

WHAT MAKES PHYSIOLOGY VALUABLE?

It's the science of life and medicine, integrating the life sciences from molecule to organism. Through the study of how the cells, tissues, and organs of the body function and interact, physiologists contribute to fundamental breakthroughs in science and medicine, providing the basis for our understanding of human and animal health. Swedish chemist and inventor Alfred Nobel recognized this when he included Physiology or Medicine among the annual prizes he endowed to recognize achievements that bettered humanity.
